Essential Oils: Contact Allergy and Chemical Composition provides a full review of contact allergy to essential oils along with detailed analyses of the chemical composition of essential oils known to cause contact allergy. In addition to literature data, this book presents the results of nearly 6,400 previously unpublished sample analyses, by far the largest set of essential oils analyses ever reported in a single source of scientific literature. Covering 91 essential oils and two absolutes, the book presents an alphabetical list of all 4,350 ingredients that have been identified in them, a list of chemicals known to cause contact allergy and allergic contact dermatitis, and tabular indications of the ingredients that can be

found in each essential oil. The book discusses contact allergy and allergic contact dermatitis for each of the oils and absolutes, sometimes able to provide only one or two reports but drawing upon considerable amounts of literature in other cases, such as with tea tree oil, ylang-ylang oil, lavender oil, rose oil, turpentine oil, jasmine absolute, and sandalwood oil. While limited information on the main components and their concentrations would be enough for most dermatologists, this book gives extensive coverage not only to improve levels of medical knowledge and quality of patient care, but also for the benefit of professionals beyond clinical study and practice, such as chemists in the perfume and cosmetics industries, perfumers, academic scientists working with essential oils and fragrances, aromatherapists, legislators, and those involved in the production, sale, and acquisition of essential oils.

The treatment of childhood cancer has become increasingly successful over the last forty years, and during the last two decades in particular, and the overall cure rate is now 60-70%. This, in turn, has introduced new issues for the clinician as the number of long-term survivors has increased. Some of the therapies that have contributed most to the improvement in survival are now known to have serious consequences for the patient in later life, and many survivors will be affected by physical, educational and psychological disability to a lesser or greater degree. This definitive reference brings together all aspects of long-term effects of treatment for cancer during childhood in a single comprehensive volume. International in perspective, the book is structured

according to complication rather than original site of malignancy for ease of reference. Topics covered include problems in the neurological system and special senses of sight and sound, cardiovascular, respiratory, gastrointestinal, urological and musculoskeletal complications, effects on the endocrine system and, in particular, future fertility, and secondary cancers. The book also reviews in detail the important issues of quality of life, prevention initiatives and strategies for long-term follow up. Key point summaries are included throughout, and the references are annotated to guide the reader quickly to seminal primary papers and key review articles. With an accessible and consistent approach throughout, *Late Effects of Childhood Cancer* is an invaluable source of information and guidance for pediatric oncologists, who need to keep fully informed in order to advise patients and their
