This easy-to-use atlas comprises a collection of representative common and unusual virtual colonoscopy (CT colonography, CTC) cases that physicians and radiologists may expect to encounter during their clinical practice. The atlas reflects the important recent advances in image acquisition, patient preparation, and image processing and is thus completely up-to-date. Each case is presented with the native CT images, integrated images obtained by 3D image processing, and colonoscopic correlation. Topics covered include normal appearances, anatomical variants, pitfalls, diverticula, lipomas, inflammatory bowel disease, polyps, flat lesions, cancers, and the postsurgical colon. By presenting the main features of anatomy and pathology, this atlas will serve as an invaluable tool both for radiologists performing CTC and for clinicians who need to review the CTC examinations of their patients.

This open access book deals with imaging of the abdomen and pelvis, an area that has seen considerable advances over the past several years, driven by clinical as well as technological developments. The respective chapters, written by internationally respected experts in their fields, focus on imaging diagnosis and interventional therapies in abdominal and pelvic disease; they cover all relevant imaging modalities, including magnetic resonance imaging, computed tomography, and positron emission

to rare gastrointestinal neoplasms. Examples of critical cases that must be diagnosed immediately to avert potential disaster in daily practice and on exams such as intussusception, volvulus and mesenteric ischemia

Colorectal cancer is the third-ranked neoplasm in order of incidence and mortality worldwide, and it is the second cause of cancer death in industrialized countries. Risk factors that increase the likelihood of developing colorectal cancer include diet, genetic mutations, alcohol abuse, smoking, and being over 50 years of age. In Canada, over 20,000 cases of colorectal cancer are diagnosed annually, highlighting the importance of early detection, diagnosis and treatment of the disease. Colorectal cancer can be screened using fecal occult blood testing (FOBT), double contrast barium enema (DCBE), sigmoidoscopy and colonoscopy. More than 90% of colorectal cancers arise from adenomatous polyps, which are abnormal growths of tissue projecting from the lining of the colon or rectum. Colonoscopy and flexible sigmoidoscopy are two procedures that are currently used to detect and locate colon polyps and carcinomas. Computed tomographic colonography (CTC), or virtual colonoscopy, is an imaging technique of the colon involving helical computed tomography and computer software to generate high-resolution two- and three-dimensional images of the inner surface of the colon. CTC is less invasive, requires less bowel preparation, does not require sedation or analgesia, takes less time, and can be performed in patients who have had incomplete colonoscopy or are contraindicated for colonoscopy. Disadvantages of CTC include high cost, high radiation dose, and less sensitivity and specificity than colonoscopy. A previous CADTH report published in 2008 compared the clinical- and cost-effectiveness of colonoscopy to sigmoidoscopy and CTC in the context of colorectal cancer screening. This report found that CTC did not perform as well as colonoscopy in the detection of colorectal lesions, particular

This book constitutes the refereed proceedings of the 5th International Workshop CCAA 2013, held in conjunction with MICCAI 2013, in Nagoya, Japan, in September 2013. The book includes 32 papers which were carefully reviewed and selected from 38 submissions. The topics covered are abdominal atlases, shape analysis and morphology in abdominal structures and organs, detection of anatomical and functional landmarks, dynamic, functional, physiologic, and anatomical abdominal imaging, registration methods for abdominal intra- and inter-patient variability, augmented reality techniques for intervention, clinical applications in radio-frequency ablation, open surgery, and minimally invasive surgery.

50 Imaging Studies Every Doctors Should Know presents key studies that have shaped the practice of radiology. Selected using a rigorous methodology, the studies cover topics including: headache, back pain, chest pain, abdominal and pelvic pain, bone, joint, and extremity pain, cancer screening and management, and radiation exposure from medical imaging. For each study, a concise summary is presented with an emphasis on the results and limitations of the study, and its implications for practice. An illustrative clinical case and radiologic image conclude each review, followed by brief information on other relevant studies. This book is a must-read for health care professionals and anyone who wants to learn more about the data behind clinical practice.

This book explains every aspect of the role of radiographers in performing CT colonography (CTC) and interpreting CTC images with the aim of enabling radiographers to extend the scope of their practice. It provides all the information required with respect to procurement of informed consent, principles of CT

and radiation dose, patient preparation and positioning, the use of contrast media, the performance of diagnostic and screening CTC studies, and the interpretation and reporting of images. A wide range of CTC findings are described and depicted, covering normal anatomy, artifacts, hemorrhoids, polyps, colon cancer, diverticular disease, lipomas, and extracolonic structures. In addition, a chapter focusing on self-assessment of image interpretation will aid learning. The rising number of CTC studies for colon disorders is adding to an already burdened radiology workload. To reduce this workload, radiographers will increasingly be given responsibility to carry out CTC examinations and this book will provide the support that they need in order to perform CTC studies to the standard required.
