comprehend the given parameters. Or to put it another way, data mining is simply a method of researching to determine a particular outcome based on the total of the gathered data.

## **Data Mining Vs. Machine Learning: What Is the Difference?**

Machine learning can look at patterns and learn from them to adapt behavior for future incidents, while data mining is typically used as an information source for machine learning to pull from. Although data scientists can set up data mining to automatically look for specific types of data and parameters, it doesn't learn and apply knowledge on its own without human interaction.

## **Data Mining vs. Machine Learning: What's The Difference ...**

Abstract. Data mining is the search for hidden relationships in data sets. Machine learning is implementing some form of artificial "learning", where "learning" is the ability to alter an existing model based on new information. Businesses use data mining techniques to identify potentially useful information in their data, in order to aid business decision making processes.

The Data Mining and Machine Learning lab (DMML) is led by Professor Huan Liu with a research focus on developing computational methods for data mining, machine learning, and social computing, and designing efficient algorithms to enable effective problem solving ranging from text/web mining, feature selection with a focus on real-world applications.

## **Data Mining and Machine Learning lab (DMML)**

Data mining is a more manual process that relies on human intervention and decision making. But, with machine learning, once the initial rules are in place, the process of extracting information and 'learning' and refining is automatic, and takes place without human intervention. In other words, the machine becomes more intelligent by itself.
