Like previous editions, this text has retained its excellent coverage of basic concepts and broad coverage of the major aspects of aerodynamics. Numerical techniques are described for computing inviscid incompressible flow about airfoils and finite wings. Plus, the design of devices and aircraft components that were constructed from theoretical considerations are shown so readers can see the ...

This is a revision of leading textbook for introductory courses in aerodynamics for junior/senior engineering students.

Updated to include more extensive use of vectors, contemporary forwardswept and oblique-wing design concepts, expanded

coverage of boundary layer control, additional problems, and extensive photographs to illustrate fluid flow concepts.

Starting from a basic knowledge of mathematics and mechanics gained in standard foundation classes, *Theory of Lift: Introductory Computational Aerodynamics in MATLAB/Octave* takes the reader conceptually through from the fundamental mechanics of lift to the stage of actually being able to make practical calculations and predictions of the coefficient of lift for realistic wing profile and planform geometries. The classical framework and methods of aerodynamics are covered in detail and the reader is

shown how they may be used to develop simple yet powerful MATLAB or Octave programs that accurately predict and visualise the dynamics of real wing shapes, using lumped vortex, panel, and vortex lattice methods. This book contains all the mathematical development and formulae required in standard incompressible aerodynamics as well as dozens of small but complete working programs which can be put to use immediately using either the popular MATLAB or free Octave computational modelling packages. Key features:

- Synthesizes the classical foundations of aerodynamics with hands-on computation, emphasizing interactivity and visualization.
- Includes complete source code for all programs, all listings having been tested for compatibility with both MATLAB and Octave.
